### 3.3 Strapping Pins

**Note:**

The content below is excerpted from Section *Strapping Pins* in [ESP32-S2 Series Datasheet](#). For the strapping pin mapping between the chip and modules, please refer to Chapter [5 Module Schematics](#).

### 3.4 Strapping Pins

**Note:**

The content below is excerpted from [ESP32-S2 Series Datasheet](#) > Section *Strapping Pins*. For the strapping pin mapping between the chip and modules, please refer to Chapter [5 Module Schematics](#).

At each startup or reset, a chip requires some initial configuration parameters, such as in which boot mode to load the chip, voltage of flash memory, etc. These parameters are passed over via the strapping pins. After reset, the strapping pins operate as regular IO pins.

The parameters controlled by the given strapping pins at chip reset are as follows:

- **Chip boot mode** – GPIO0 and GPIO46
- **VDD\_SPI voltage** – GPIO45
- **ROM messages printing** – GPIO46

GPIO0, GPIO45, and GPIO46 are connected to the chip's internal weak pull-up/pull-down resistors at chip reset. These resistors determine the default bit values of the strapping pins. Also, these resistors determine the bit values if the strapping pins are connected to an external high-impedance circuit.

**Table 4: Default Configuration of Strapping Pins**

Strapping Pin	Default Configuration	Bit Value
GPIO0	Pull-up	1
GPIO45	Pull-down	0
GPIO46	Pull-down	0

To change the bit values, the strapping pins should be connected to external pull-down/pull-up resistances. If the ESP32-S2 is used as a device by a host MCU, the strapping pin voltage levels can also be controlled by the host MCU.

All strapping pins have latches. At system reset, the latches sample the bit values of their respective strapping pins and store them until the chip is powered down or shut down. The states of latches cannot be changed in any other way. It makes the strapping pin values available during the entire chip operation, and the pins are freed up to be used as regular IO pins after reset.

Regarding the timing requirements for the strapping pins, there are such parameters as *setup time* and *hold time*. For more information, see [Table 5](#) and [Figure 4](#).

Table 5: Description of Timing Parameters for the Strapping Pins

Parameter	Description	Min (ms)
$t_{SU}$	Setup time is the time reserved for the power rails to stabilize before the CHIP_PU pin is pulled high to activate the chip.	0
$t_H$	Hold time is the time reserved for the chip to read the strapping pin values after CHIP_PU is already high and before these pins start operating as regular IO pins.	3

Figure 4: Visualization of Timing Parameters for the Strapping Pins

### 3.4.1 Chip Boot Mode Control

GPIO0 and GPIO46 control the boot mode after the reset is released. See [Table 6 Chip Boot Mode Control](#).

Table 6: Chip Boot Mode Control

Boot Mode	GPIO0	GPIO46
Default configuration	1 (Pull-up)	0 (Pull-down)
SPI Boot (default)	1	Any value
Download Boot	0	0
Invalid combination <sup>1</sup>	0	1

<sup>1</sup> This combination triggers unexpected behavior and should be avoided.

### 3.4.2 VDD\_SPI Voltage Control

Depending on the value of EFUSE\_VDD\_SPI\_FORCE, the voltage can be controlled in two ways.

Table 7: VDD\_SPI Voltage Control

EFUSE_VDD_SPI_FORCE	GPIO45	eFuse <sup>1</sup>	Voltage	VDD_SPI power source <sup>2</sup>

		1	3.3 V	VDD3P3_RTC_IO via R <sub>SPI</sub>

<sup>1</sup> eFuse: EFUSE\_VDD\_SPI\_TIEH

<sup>2</sup> See [ESP32-S2 Series Datasheet](#) > Section Power Scheme

### 3.4.3 ROM Messages Printing Control

During boot process the messages by the ROM code can be printed to:

- **(Default) UOTXD pin.** For this, EFUSE\_UART\_PRINT\_CONTROL should be 0.
- **DAC\_1 pin.** For this, EFUSE\_UART\_PRINT\_CONTROL should be 1.

EFUSE\_UART\_PRINT\_CONTROL and GPIO46 control ROM messages printing as shown in [Table 8 ROM Messages Printing Control](#).

Owing to the use of advanced power-management technologies, the module can switch between different power modes. For details on different power modes, please refer to Section *RTC and Low-Power Management*

in [ESP32-S2 Series Datasheet](#).

### 4.4.1 Current Consumption in Active Mode

Table 12: RF Current Consumption in Active Mode

Work mode	Description		Peak (mA)
Active (RF working)	TX	802.11b, 20 MHz, 1 Mbps, @19 dBm	302
		802.11g, 20 MHz, 54 Mbps, @17.5 dBm	264
		802.11n, 20 MHz, MCS7, @16.5 dBm	257
		802.11n, 40 MHz, MCS7, @16.5 dBm	267
	RX	802.11b/g/n, 20 MHz	77
		802.11n, 40 MHz	81

<sup>1</sup> The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on 100% duty cycle.

<sup>2</sup> The current consumption figures in RX mode are for cases where the peripherals are disabled and the CPU idle.

**Note:**

The content below is excerpted from *Section Power Consumption in Other Modes* in [ESP32-S2 Series Datasheet](#).

### 4.4.2 Current Consumption in Other Modes

The measurements below are applicable to ESP32-S2, ESP32-S2FH2, and ESP32-S2FH4. Since ESP32-S2FN4R2 and ESP32-S2R2 come with in-package PSRAM, their current consumption might be higher.

Table 13: Current Consumption in Modem-sleep Mode

Mode	CPU Frequency (MHz)	Description	Typ	
			All Peripherals Clocks Disabled (mA)	All Peripherals Clocks Enabled (mA) <sup>1</sup>
Modem-sleep <sup>2,3</sup>	240	CPU is idle	20.0	28.0
		CPU is running	23.0	32.0
	160	CPU is idle	14.0	21.0

Cont'd on next page

Table 13 – cont'd from previous page

Mode	CPU Frequency (MHz)	Description	Typ	
			All Peripherals Clocks Disabled (mA)	All Peripherals Clocks Enabled (mA) <sup>1</sup>
	80	CPU is running	16.0	24.0
		CPU is idle	10.5	18.4
		CPU is running	12.0	20.0

<sup>1</sup> In practice, the current consumption might be different depending on which peripherals are enabled.

<sup>2</sup> In Modem-sleep mode, Wi-Fi is clock gated.

<sup>3</sup> In Modem-sleep mode, the consumption might be higher when accessing flash. For a flash rated at 80 Mbit/s, in SPI 2-line mode the consumption is 10 mA.

Table 14: Current Consumption in Low-Power Modes

Work mode	Description	Typ ( $\mu$ A)	
Light-sleep <sup>1</sup>	VDD_SPI and Wi-Fi are powered down, and all GPIOs are high-impedance	750

		ULP-RISC-V	190
	ULP sensor-monitored pattern <sup>3</sup>		22
	RTC timer + RTC memory		25
	RTC timer only		20
Power off	CHIP_PU is set to low level, the chip is powered off	1	

<sup>1</sup> In Light-sleep mode, with all related SPI pins pulled up, the current consumption of the embedded PSRAM is 140  $\mu$ A. Chip variants with in-package PSRAM include ESP32-S2FN4R2 and ESP32-S2R2.

<sup>2</sup> During Deep-sleep, when the ULP co-processor is powered on, peripherals such as GPIO and I2C are able to operate.

# 5 Module Schematics

This is the reference design of the module.

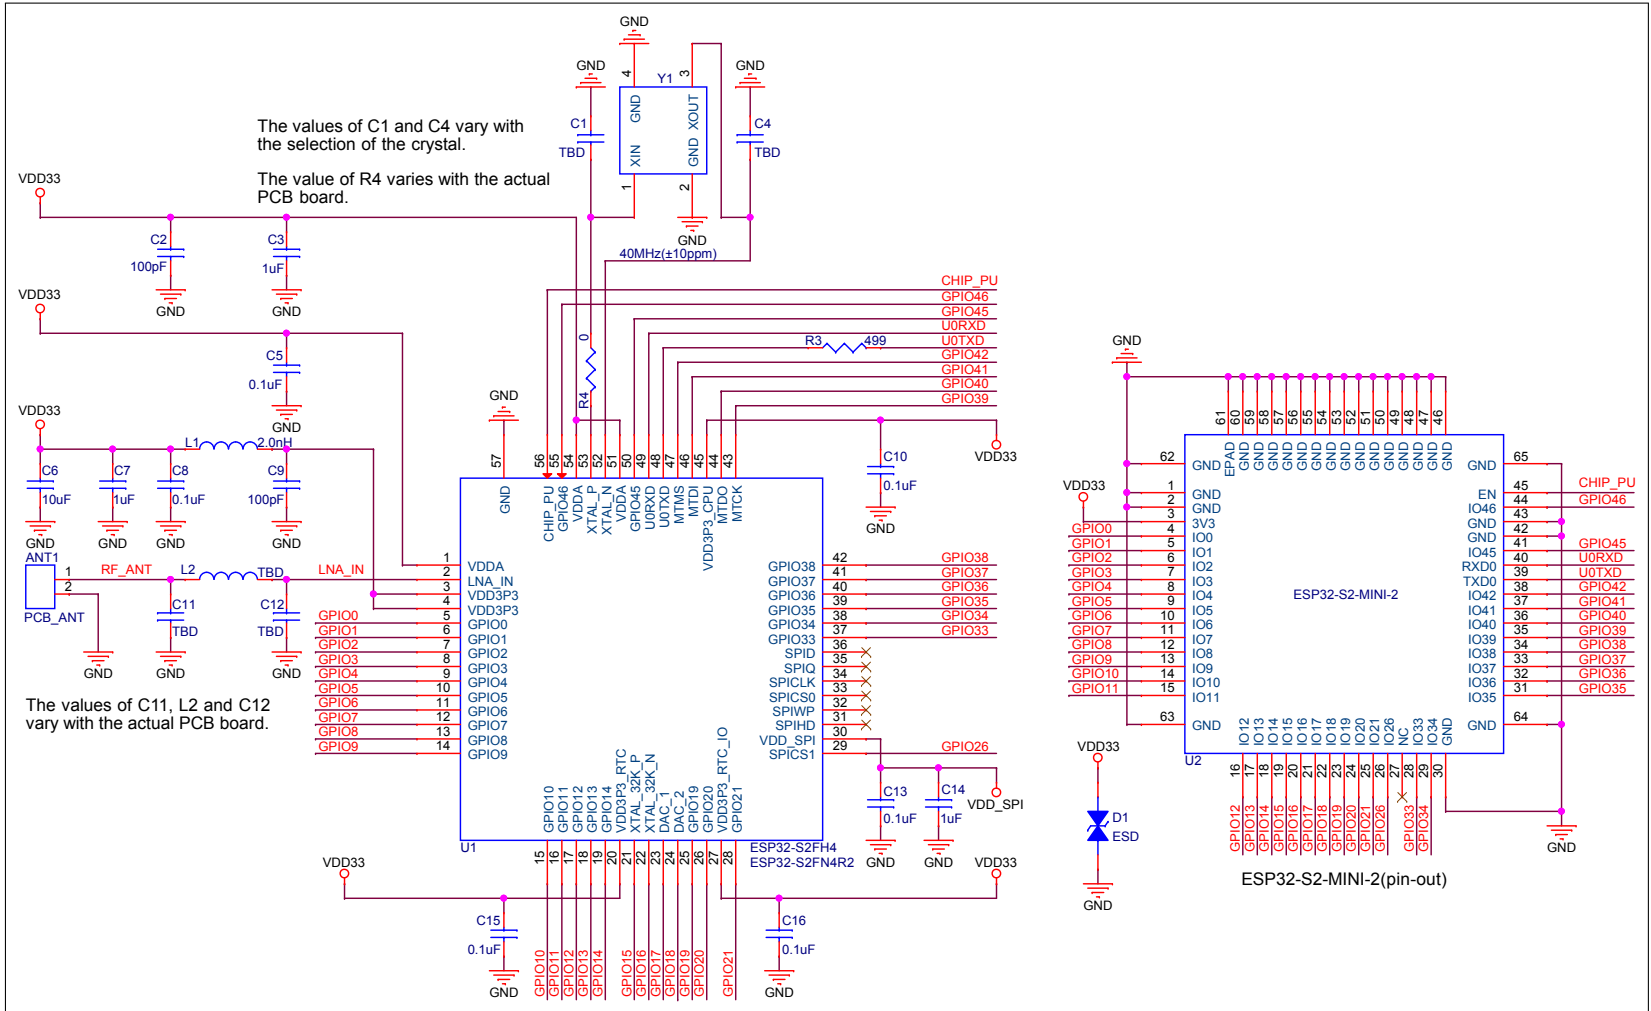

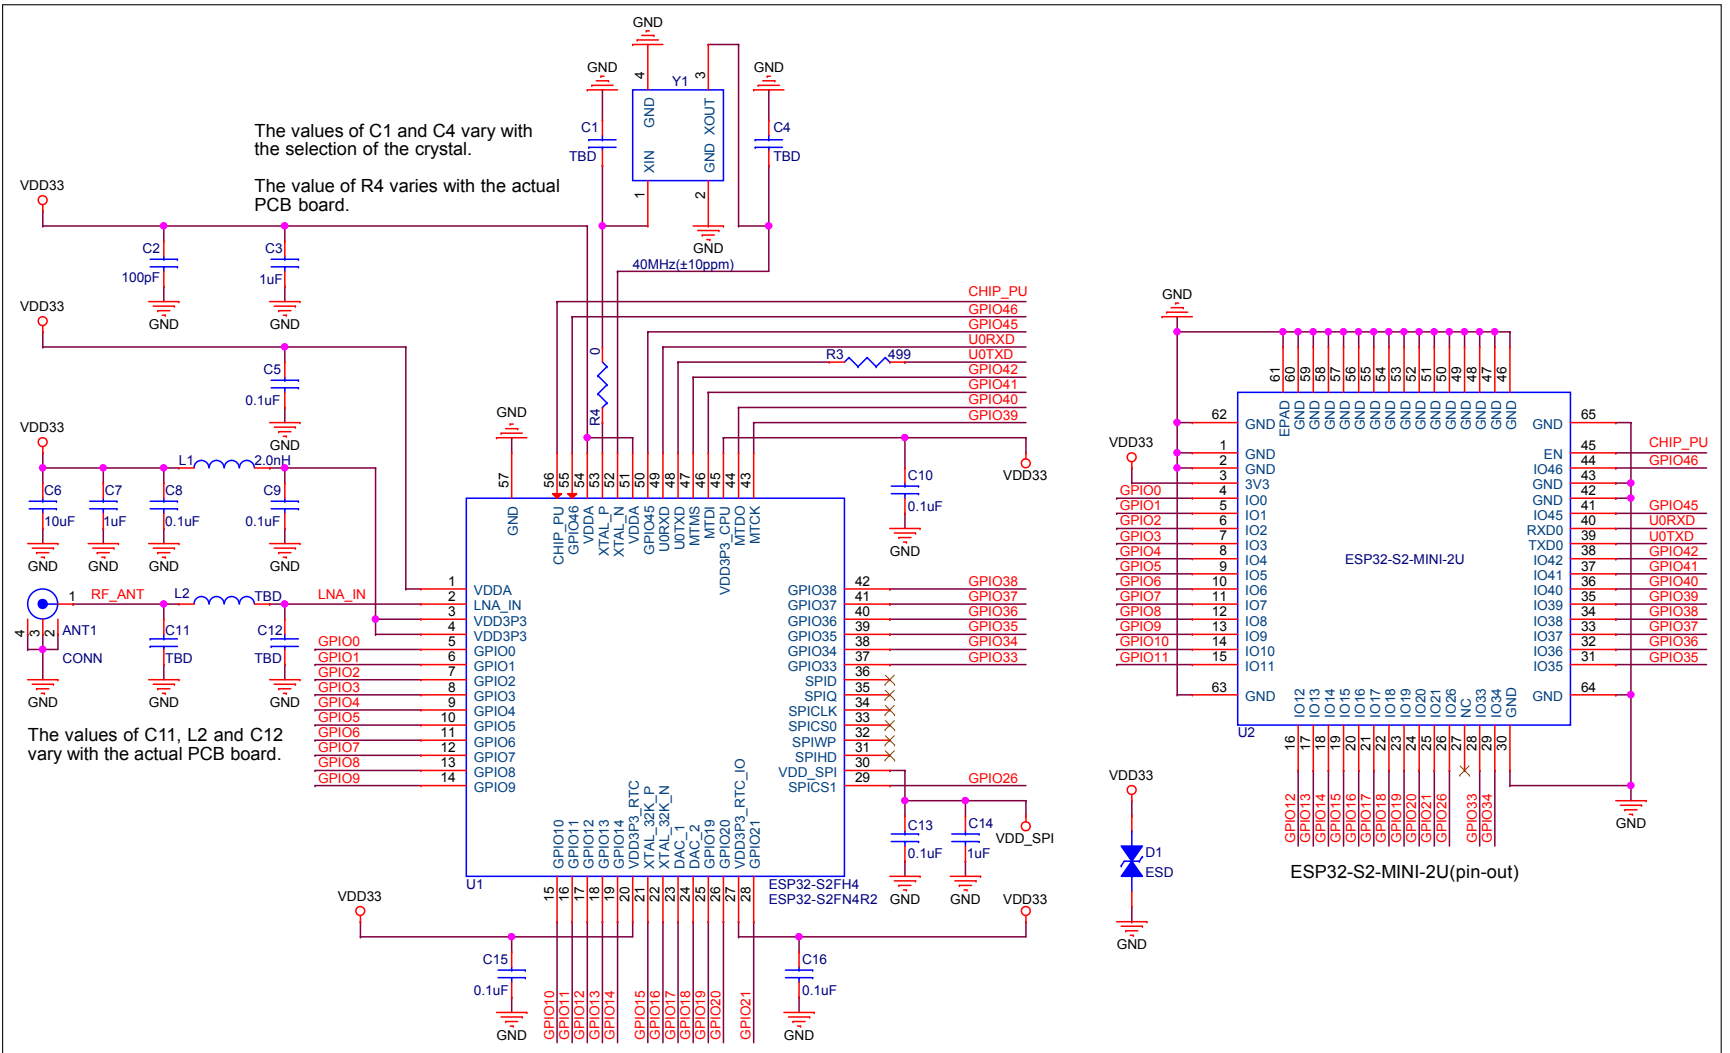

Figure 5: ESP32-S2-MINI-2 Schematics

## 6 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

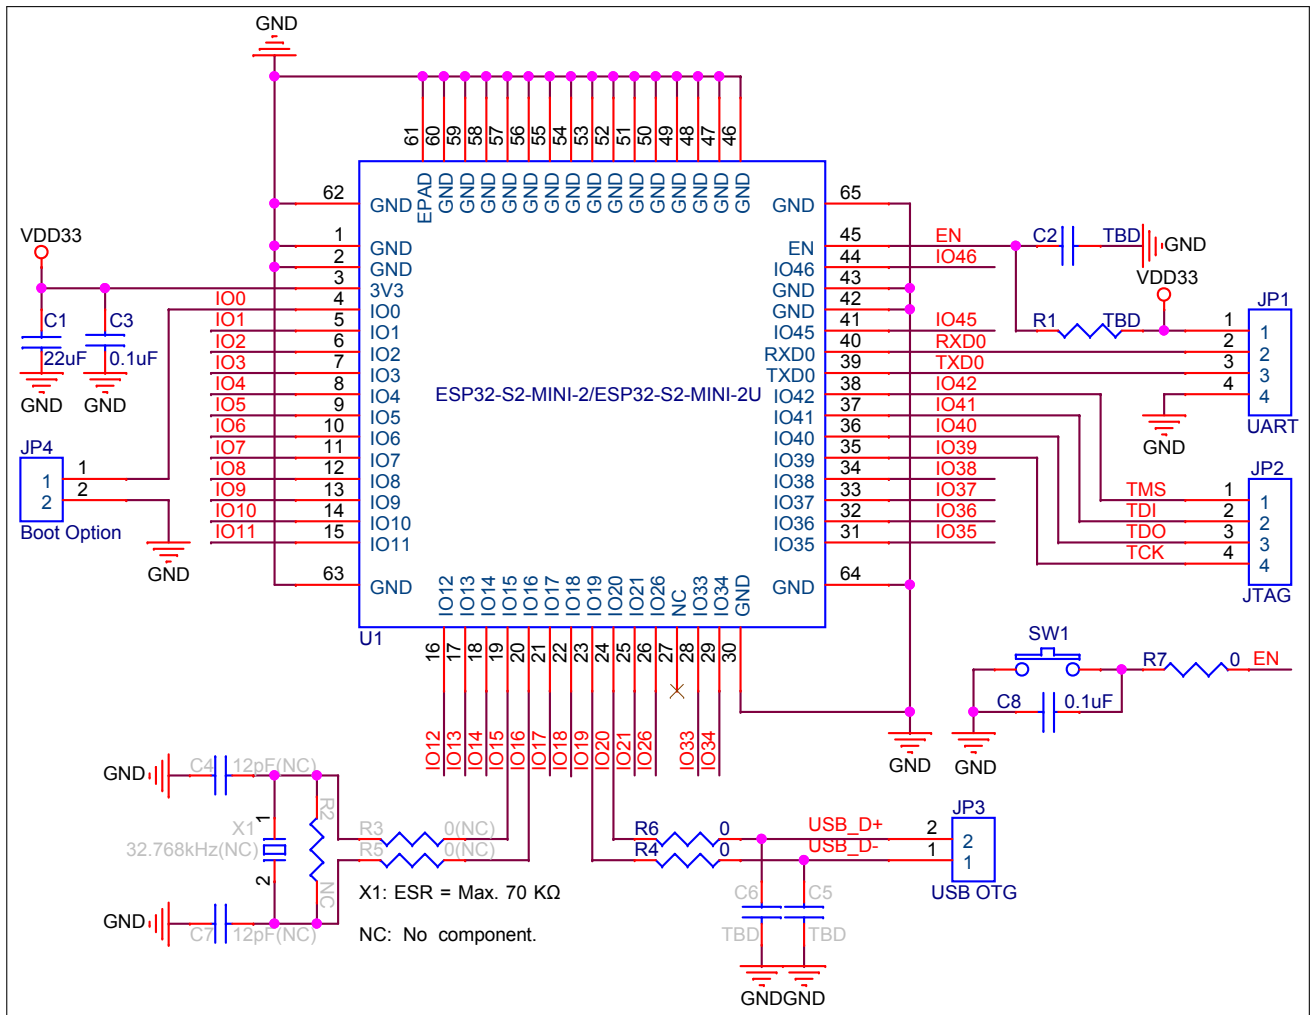

Figure 7: Peripheral Schematics

- Soldering the EPAD to the ground of the base board is not a must, however, it can optimize thermal performance. If you choose to solder it, please apply the correct amount of soldering paste. Too much soldering paste may increase the gap between the module and the baseboard. As a result, the adhesion between other pins and the baseboard may be poor.
- To ensure that the power supply to the ESP32-S2 chip is stable during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually  $R = 10\text{ k}\Omega$  and  $C = 1\text{ }\mu\text{F}$ . However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32-S2's power-up and reset sequence timing diagram, please refer to [ESP32-S2 Series Datasheet](#) > Section *Power Scheme*.

## 7 Physical Dimensions and PCB Land Pattern

### 7.1 Physical Dimensions

**Note:**

For information about tape, reel, and product marking, please refer to [Espressif Module Packaging Information](#).

### 7.3 Dimensions of External Antenna Connector

ESP32-S2-MINI-2U uses the third generation external antenna connector as shown in Figure 12 *Dimensions of External Antenna Connector*. This connector is compatible with the following connectors:

- W.FL Series connector from Hirose
- MHF III connector from I-PEX
- AMMC connector from Amphenol

## 8 Product Handling

### 8.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and 90%RH. The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions  $25\pm 5\text{ }^{\circ}\text{C}$  and 60%RH. If the above conditions are not met, the module needs to be baked.

### 8.2 Electrostatic Discharge (ESD)

- Human body model (HBM):  $\pm 2000\text{ V}$
- Charged-device model (CDM):  $\pm 500\text{ V}$

### 8.3 Soldering Profile

#### 8.3.1 Reflow Profile

Solder the module in a single reflow.

Figure 13: Reflow Profile

## 8.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
